The use of the central bibliographic and content data services by the librarians of minor Libraries

A significant group of users of the central bibliographic and content data services are the librarians of libraries of small and medium size. Their importance is due to their large numbers, and the fact that for the lot of people (living in the countryside, or being customers of libraries of firms, or being Hungarians living outside of the current borders of the Republic of Hungary) these institutes are the only resource for library services. Especially important are the libraries of educational institutes, because they make the first impression on the students about the libraries and library services. So during planning and building central library and bibliographic services we have to take care of the demands of the librarians of this group too. These libraries have mainly financial problems, and lack staff. To increase the quality of their services, they have to use the central services, and have to let their customers to use these services as well. This paper is interested in mainly the users of Kistéka, an integrated library automation software, because the author is up to date their everyday work and problems, and Kistéka is especially planned to make the librarians of small and medium libraries able to use these services.
