JaDoX, the eLibrary module of HunTéka integrated library management system

In 2002, MTA SZTAKI and iKron Ltd. released a new integrated library management system called HunTéka. In 2004, it was installed at more than 20 locations in Hungary, and the number is still growing. Developing process continues based on our plans and the valuable feedback of HunTéka users.

This year, we are introducing a new HunTéka module called JaDoX, which greatly simplifies digitising work starting from document processing through standardised storage to publishing on the Internet. JaDoX is a platform-independent document handling system based on open standards.

JaDoX editor helps to transform unstructured text sources into TEI-based XML documents after recognition and proofing preparation. The result can be easily uploaded to the JaDoX server by one key press or mouse click. The JaDoX server stores the documents in relational database. It serves the documents for browsing, searching and publishing methods, which can be initiated on the web user interface.
