The ETR as a platform of authentication

In the course of growth of intranet services of Pécs University there is increasing demand on authentication of users. Several attempts were made for finding a technical solution and for the acquisition of user data. Today the ETR is the most developed integrated information system in the University, including growing number of intranet solutions and the most authoritative personal database.

In place of technical details, data structures and protocols in my presentation
I will emphasise the source and handling of data, organisational and security questions.

Some of questions are still waiting for an answer, but the main direction has already been set.
