Nowadays electronic information sources get more and more function in the education. It's so natural for us to use online dictionaries, encyclopaedias, and to get information of a field of science from the Internet.

How can we create such up-to-date information services, RSS feeds, and encyclopaedias containing the basic vocabulary of our courses? How to make students to participate in this project (e.g.: Wiki)?

Moodle, the open source learning management system can help us to solve this kind of problems.
