

## Efficient Teamwork using Microsoft softwares

This presentation demonstrates what services Microsoft SharePoint products (SharePoint Portal Server 2003, Windows SharePoint Services) provide to streamline workgroup members' individual and communal performance, and how they help quick, effective and secure sharing of information and data between the users.

In the presentation we also review the new possibilities introduced by the integration of SharePoint, Office 2003 and Exchange Server 2003. Further benefit of a SharePoint based portal solution is that the consistent infrastructure available after installation can be customized or added to – depending on the customer's needs – with various tools, while retaining full usability of the provided services.

Besides basic features, we also mention programming and customization features provided by the technology, as well as methods to use these services optimally. Our SharePoint-based websites can be custom-tailored not only by the built-in components, but new services or custom-developed ASP.NET components can be added as well.
